lecture 12: reflector antennas - mcmaster university - the simplest reflector antenna consists of two components: a reflecting surface and a much smaller feed antenna at the reflector's focal point. constructions that are more complex involve a secondary reflector (a subreflector) at the focal point, which is illuminated by a primary feed. these are called dual-reflector antennas. **reflector and lens antennas type - where receiving antennas and circuitry are placed to sample the image, which is a discrete fourier transform of the incoming wavefront. the discrete lens has improved focusing properties over some dielectric lenses and reflector antennas, as it can be designed for low side lobe levels at large steering angles. **lecture notes - antennas** - reflector and lens standing wave (resonant) antenna: swr pattern of and is formed by the reflection from open end of the wire. travelling wave (non-resonant) antenna: the proper termination of the antenna so that is minimized. it has uniform pattern (surface wave (slow wave) and leaky wave (fast wave) antennas). **multiple reflector dish antennas - emerge only for an infinite reflector or lens and omnidirectional source. for realistic feeds and antennas, however, the spillover and illumination losses are inherently present: the former are associated with the power that misses reflector or lens whereas the latter are due to a non-uniform illumination of the reflector or the lens front part, as **lens antennas - analysis and synthesis at mm-waves** - lens antennas consist of two main parts: the feeding antenna that can be any other type of antenna (horns, dipoles, microstrip (patch) antennas, and even arrays of antenna elements) and lens that collimate incident divergent energy to prevent it from spreading in undesired directions. fig. 1. layered cylindrical dielectric lens **lecture 14: reflector antennas introduction** - lecture 14: reflector antennas introduction high-gain antennas are required for long-distance radio communications (radio-relay links and satellite links), high-resolution radars, radioastronomy, etc. reflector systems are probably the most widely used high-gain antennas. they can easily achieve gains of above 30 db for microwave frequencies ... **development of a reflector ira and a solid dielectric lens ...** -
